Introduction Based on lecture notes of two summer schools with a mixed audience from mathematical sciences, epidemiology and public health, this volume offers a comprehensive introduction to basic ideas and techniques in modeling infectious diseases, for the comparison of strategies to plan for an anticipated epidemic or pandemic, and to deal with a disease outbreak in real time.

Mathematical models can project how infectious diseases progress to show the likely outcome of an epidemic and help inform public health interventions. Models use basic assumptions or collected statistics along with mathematics to find parameters for various infectious diseases and use those parameters to calculate the effects of different interventions, like mass vaccination programmes. The modelling can help decide which intervention/s to avoid and which to trial, or can predict future growth

The first contributions to modern mathematical epidemiology are due to P.D. En'ko between 1873 and 1894 (En'ko, 1889), and the foundations of the entire approach to epidemiology based on compartmental models were laid by public health physicians such as Sir R.A. Ross, W.H. Hamer, A.G. McKendrick, and W.O. Kermack between 1900 and 1935, along with important contributions from a statistical perspective by J. Brownlee.

Mathematical epidemiology: Past, present, and future ...

The mathematical approach is complex and not an introduction to the field. The formalism and definitions in symbolism is not presented for epidemiologists. Public health professionals will find it a difficult read, restricting its use to specialized mathematical and statistics circles.

cess of mathematical modeling? Generally speaking, the modeling process involves the following six stages: 1. Make assumptions about the disease transmission process based on the best available biological knowledge on the pathogenesis of the infection and epidemiology of the disease. 2. Set up mathematical models for the transmission process based on these
