So the solution here, so the solution to a differential equation is a function, or a set of functions, or a class of functions. It's important to contrast this relative to a traditional equation. So let me write that down. So a traditional equation, maybe I shouldn't say traditional equation, differential equations have been around for a while.

This zero chapter presents a short review. 0.1 The trigonometric functions The Pythagorean trigonometric identity is $\sin^2 x + \cos^2 x = 1$, and the addition theorems are $\sin(x + y) = \sin(x)\cos(y) + \cos(x)\sin(y)$, $\cos(x + y) = \cos(x)\cos(y) - \sin(x)\sin(y)$.

 $x(0; y) = x(0; y)$; hence, $x(t+T; y) = x(t; y)$ for all $t \geq 0$. Given the existence of fixed points for the Poincaré map, one defines stability as below. Definition 5.31. p is a stable fixed point of P if for each $\epsilon > 0$ there is a $\delta > 0$ such that if $|x - p| < \delta$, then $|P^n(x) - p| < \epsilon$ for all $n \geq N$. Otherwise, the fixed point is unstable.

Introduction to Ordinary Differential Equations

CLASSIFICATION BY ORDER The order of a differential equation (either ODE or PDE) is the order of the highest derivative in the equation. For example, is a second-order ordinary differential equation. First-order ordinary differential equations are occasionally written in differential form $M(x, y)dx + N(x, y)dy = 0$.
