Mathematical Optimization Models And Methods
Mathematical optimization is used in much modern controller design. High-level controllers such as model predictive control (MPC) or real-time optimization (RTO) employ mathematical optimization. These algorithms run online and repeatedly determine values for decision variables, such as choke openings in a process plant, by iteratively solving a mathematical optimization problem including constraints and a model of the system to be controlled.

Optimization models Optimization models are based on operation research tools for optimization and use some form of mathematical programming to select a set of projects which deliver the maximum benefit (e.g., NPV, IRR, PBP) represented for and objective function subjected to a series of constraints (e.g., cost, people, technical restrictions).
