The Ruas Lab - Molecular and cellular exercise physiology. Research in our laboratory is aimed at understanding the molecular mechanisms that mediate skeletal muscle adaptations to diverse challenges and their local and systemic consequences. We are particularly interested in understanding how exercised or sedentary skeletal muscle can crosstalk with other organs, and how it can affect individual health and disease.

INEW! Molecular And Cellular Exercise Physiology 1st Edition

Molecular exercise physiology is the study of exercise physiology using molecular biology methods. The development of differentiated cell types is regulated by transcription factors like the muscle-making MyoD that specifies cell type, while others regulate the development of muscle, tendons, and bones. Maternal nutrition and exercise commonly affect embryonic development through epigenetic mechanisms.
