Scientific American executive editor Guterl begins by discussing mass extinction, a process that has occurred half-a-dozen times over life's 2.5-billion-year history, eliminating up to 90 percent of species. The survivors thrived, and the current mass extinction (already in progress) may not eliminate the human species, but

In addition to bird species, four-legged, grounded animals face a similar fate. The Peninsula bighorn sheep, which roam hundreds of square miles and seasonally migrate through the U.S.-Mexico border, are just one such species that Stanford biologist Rodolfo Dirzo said in a university Q&A could be “genetically doomed.”

In the history of planet earth, mass species extinctions have occurred five times, about once every 100 million years. A "sixth extinction" is known to be underway now, with over 200 species dying off every day. Not only that, but the cause of the sixth extinction is also the source of single biggest threat to human life: our own inventions. What this bleak future will truly hold, though, is much in dispute. Will our immune systems be attacked by so-called super bugs, always evolving, and now more easily spread than ever? Will the disappearance of so many species cripple the biosphere? Will global warming transform itself into a runaway effect, destroying ecosystems across the

Read Book The Fate Of The Species Why The Human

planet? In this provocative book, Fred Guterl examines each of these scenarios, laying out the existing threats, and proffering the means to avoid them. This book is more than a tour of an apocalyptic future; it is a political salvo, an antidote to well-intentioned but ultimately ineffectual thinking. Though it's honorable enough to switch light bulbs and eat home-grown food, the scope of our problems, and the size of our population, is too great. And so, Guterl argues, we find ourselves in a trap:

Technology got us into this mess, and it's also the only thing that can help us survive it. Guterl vividly shows where our future is heading, and ultimately lights the route to safe harbor.

"A beautifully written book that will make you think and worry."--Fareed Zakaria

At Home with the Gopher Tortoise: The Story of a Keystone Species teaches young readers about the gopher tortoise and the more than 360 different kinds of animals that depend on it for survival. From owls to rabbits, from skunks to scorpions, the gopher tortoise provides creatures with shelter, food, or a place to raise their young. In this fascinating tale of ecological interdependency, glorious illustrations reveal the gopher tortoise's world both below and

above ground, showing children how the fate of one species is important to so many others.

This book examines the long-term fate of invasive species by detailing examples of invaders from different zoological and botanical taxa from various places around the world. Readers will discover what happened, after a century or so, to 'classical' invaders like rabbits in Australia, house sparrows in North America, minks in Europe and water hyacinths in Africa and Asia. Chapters presented in the book focus on eighteen species in the form of in-depth case studies including: earthworms, zebra mussels, Canadian water weed, Himalayan balsam, house

sparrows, rabbits, crayfish plague, Colorado beetles, water hyacinths, starlings, Argentine ant, Dutch elm disease, American mink, cane toad, raccoons, Canadian beavers, African killer bees and warty comb jelly. Invaded areas described are in Africa, Asia, Australia, Europe, North America, Pacific islands, and South America. Readers will get some ideas about the likely future of current invaders from the fate of old ones. This book is intended for undergraduates studying environmental sciences, researchers and members of environmental NGO's.
